*Description of Project*

This project will fund a mechanized water system for a healthcare facility in the Tubong-Sumondu community, providing piped water to the maternity ward and consulting rooms. Currently, water is collected from a community borehole and carried to the facility by healthcare workers or by patients and their families, as pictured. This new system will provide piped water to critical points of care, and have a tremendous impact for community members at the Tubong-Sumondu clinic, including mothers and their newborns in their maternity ward.
